MAIL DATE	DELIVERY MODE
04/28/2009	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

	Application No.	Applicant(s)
Office Action Summary	10/663,478	TRETHEWEY ET AL.
	Examiner	**Art Unit**	
	Leynna T. Truvan	2435	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on <u>02 January 2009</u>.

2a)☒ This action is **FINAL**.　　　2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) <u>1-3,5-13,15-25 and 27-31</u> is/are pending in the application.

　　4a) Of the above claim(s) <u>4,14 and 26</u> is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) <u>1-3,5-13,15-25 and 27-31</u> is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

　　Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

　　Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

　　a)☐ All　b)☐ Some *　c)☐ None of:

　　　1.☐ Certified copies of the priority documents have been received.

　　　2.☐ Certified copies of the priority documents have been received in Application No. _____.

　　　3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

　　* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1)☐ Notice of References Cited (PTO-892)

2)☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3)☐ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date _____.

4)☐ Interview Summary (PTO-413) Paper No(s)/Mail. Date. _____.

5)☐ Notice of Informal Patent Application

6)☐ Other: _____.

DETAILED ACTION

1.   Claims 1-3, 5-13, 15-25, and 27-31 are pending.

Claims 4, 14, and 26 have been cancelled.

Response to Arguments

2.   Applicant's arguments filed 1/2/2009 have been fully considered but they are not persuasive.

Regarding the argument on p.6-7, with the particulars of the wording or rewording in the last office action versus the 1/25/08 office action, that examiner is putting words into Moles. The last office action, examiner was merely reciting the entire limitation rather than cutting it off half way through the sentence. However way examiner phrases "not clearly explain" or "did not clearly suggest" still means the same thing which is to point out Moles does not inherently or explicitly teach the claimed if a privacy preference associated with the requestor has not been specified, requesting a privacy preference associated with the requestor from the user in response to receiving the request. The prior art and its teachings have not changed nor was the obviousness and motivation altered.

Moles discloses the user have the ability to selectively transmit the location of the wireless mobile station to authorized parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the transmission of information concerning the location of the wireless mobile station (col.3, lines 40-44). This is the ability to set to transmit or

not transmit the location property to a particular requestor(s) which in Moles' instance, is
for authorized parties (col.8, lines 37-64). Moles discusses the claimed privacy
preference as the privacy flag where a value that has been set determines whether
information of the location of the mobile station is to be transmitted (col.2, line 60 –
col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the privacy flag can
selectively set to cause wireless the mobile station to not transmit location information of
the mobile station and can set a value of location privacy flag whether location
information is to be transmitted (col.6, line 56-col.7, line 5). Thus, obviously suggested
sending location information if the privacy preference associated with the requestor has
not been specified otherwise. Hence, Moles did not clearly explain the claimed if a
privacy preference associated with the requestor has not been specified, requesting a
privacy preference associated with the requestor. As such, a suggestion is not an
impermissible hindsight but an obviousness that must be used in combination with
another art to provide the obviousness and motivation for a person of ordinary skills in
the art at the time the invention was made.

Regarding the argument on p. 7 (last paragraph), that the combination of Herz
with Moles does not solve the deficiencies of Moles "if a privacy preference associated
with the requestor has not been specified, requesting a privacy preference associated
with the requestor from the user in response to receiving the request", since Moles
requires the user to access the transmission status menu to answer the question of
whether location information is to be transmitted. The claimed invention does not limit
as to how or the type of way the privacy preference is to be determined or specified.

Moles entering via keypad or answering questions meets the current broad limitation of specifying the privacy preference. Thus, this reads on the claimed determining whether a privacy preference associated with the requestor has been specified.

Regarding the argument on p. 8, that Herz discloses privacy policies based on access to user's user profile, not based on a request for a location property as recited in claim 1. This limitation is not the deficiency for Herz to solve and is cited as Moles teaching this limitation (Moles - col.2, lines 10-15 and col.6, lines 21-25).

Herz is capable of associating the privacy preference with the requestor (column 14, lines 13-19) the requestor requesting privacy preference (column 15-16) associated with the requestor and the associated rules with respect to which users or user type may gain access to which information (col.15, lines 30-35). Hence, if a particular user is able to obtain location property, then the privacy or a tag can be set and that requests for the privacy policies of users is enabled/restricted with use of data mining tools suggests a privacy is not specified, then to request the privacy preference (col.15, lines 14-20).

Regarding the argument on p. 9-10, that additional information to be submitted is for purposes of matching individuals, not if a privacy preference associated with the requestor has not been specified, requesting a privacy preference associated with the requestor from the user in response to receiving the request. Herz discloses access controls may be used to enable/restrict the ability of a user (UID) to be automatically identified (col.15, lines 4-35) which obviously suggests user identity or profile is not provided because no information is given or shown that can identify the user (privacy

preference has not been specified). As such, request or queries for such information is

necessary in order to identify the user/profile if the user cannot be identified

automatically (no match or profile disabled).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

3.   **Claims 1-3, 5-13, 15-25, and 27-31 are rejected under 35 U.S.C. 103(a) as**

being unpatentable over Moles, et al. (US 6,505,048) and further in view of Hertz,

et al. (US 6,571,279).

As per claim 1:

Moles disclose a method comprising:

        receiving a request from a requestor for a location property associated with a

location of a computer system; and **(col.2, lines 10-15 and col.6, lines 21-25)**

        determining whether a privacy preference **(col.2, lines 31-40 and col.2, line 60**

– col.3, line 2; *privacy flag***)** associated with the requestor has been specified; and

(col.7, lines 5-12 and col.10, lines 37-57)

        if a privacy preference associated with the requestor has not been specified

(col.7, lines 14-18 and col.9, lines 50-53), requesting a privacy preference associated

with the requestor from the user in response to receiving the request. **(col.6, line 60 –
col.7, line 5 and col.8, lines 37-64)**

The computer system can broadly be given as a wireless mobile station (col.4,
lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the
mobile station's location is referring to the claimed requestor for the location of the
computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the
ability to selectively transmit the location of the wireless mobile station to authorized
parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the
transmission of information concerning the location of the wireless mobile station (col.3,
lines 40-44). This obviously suggests the ability to set to transmit or not transmit the
location property to a particular requestor(s) which in Moles' instance, is for authorized
parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a
privacy preference associated with the requestor has been specified. Moles discusses
the claimed privacy preference as the privacy flag where a value that has been set
determines whether information of the location of the mobile station is to be transmitted
(col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the
privacy flag can selectively set to cause wireless the mobile station to not transmit
location information of the mobile station and can set a value of location privacy flag
whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus,
obviously suggested sending location information if the privacy preference associated
with the requestor has not been specified otherwise. However, Moles did not clearly

explain the claimed requesting a privacy preference associated with the requestor if a

privacy preference associated with the requestor has not been specified.

Hertz, et al. teaches the location enhanced information delivery system can

improve the user-user automatic matching techniques by notifying users of other users

that are located in or near the same vicinity and match the profile conditions as

consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses

access control criteria dictating profile access and reachability of the user may be

controlled accordingly based upon the profile of the requestor and/or the nature of the

request (col.15, lines 11-36). Hertz includes the ability of queries and tasks

requirements in the form of request (col.15, lines 4-6). Access control criteria dictating

profile access and reachability of the user and construction of conveniently navigable

hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses

data mining tools can be used to enable advertisers to identify relevant features and

may enter rules that specify how users are to be targeted based on desired criteria

(col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests

ability for determining if a privacy preference associated with the requestor has been

specified or not and to enable or restrict the ability of an explicitly identified user (col.15,

lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be

transmitted. Thus, suggests the ability to request a privacy preference associated with

the requestor from the user in response to receiving the request if the privacy

preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to combine the teaching of Moles with Hertz to teach if a privacy preference associated with the requestor has not been specified, requesting a privacy preference in response to receiving the request because access control dictating profile access and reachability of the user may be controlled based upon the profile of the requestor such access control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16, lines 1-7).

As per claim 2: See Moles on col.2, lines 36-39 and col.2, line 66 – col.3, line 2; discussing if a privacy preference associated with the requestor has been specified, applying the specified preference to determine whether to provide the location property to the requestor.

As per claim 3: See Moles on col.2, lines 24-26 and 61-63 and col.7, lines 14-18; discussing preventing the location property from being provided to the requestor if the privacy preference specifies that the location property is to be kept private, and providing the location property to the requestor if the privacy preference specifies that the location property is to be disclosed to the requestor.

As per claim 4: Cancelled.

As per claim 5: See Moles on col.6, lines 21-24 and Hertz on col.18, lines 52-55; discussing requesting includes providing a pop-up dialog box.

As per claim 6: See Moles on col.6, lines 57-65; discussing providing a pop-up dialog box includes enabling a user to selectively enable and disable privacy for individual location properties.

As per claim 7:

Moles disclose a method comprising:

enabling a user to selectively enable and disable location-aware   computing; and (**col.2, lines 34-48**)

preventing a location property from being provided to a requestor if the user has disabled location-aware computing; and (**col.2, lines 24-26 and 61-63 and col.7, lines 14-18**)

if the user has enabled location-aware computing (**col.7, lines 5-12 and col.10, lines 37-57**), determining whether a privacy preference associated with the requestor has been specified; and (**col.2, lines 31-40 and col.2, line 60 – col.3, line 2;** *privacy flag*)

if a privacy preference associated with the requestor has not been specified (**col.7, lines 14-18 and col.9, lines 50-53**), requesting a privacy preference associated with the requestor from the user (**col.6, line 60 – col.7, line 5 and col.8, lines 37-64**) in response to receiving a request from the requestor for a location property associated with a computing system. (**col.2, lines 10-15 and col.6, lines 21-25**)

The computer system can broadly be given as a wireless mobile station (col.4, lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the mobile station's location is referring to the claimed requestor for the location of the computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the ability to selectively transmit the location of the wireless mobile station to authorized parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the

transmission of information concerning the location of the wireless mobile station (col.3, lines 40-44). This obviously suggests the ability to set to transmit or not transmit the location property to a particular requestor(s) which in Moles' instance, is for authorized parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a privacy preference associated with the requestor has been specified. Moles discusses the claimed privacy preference as the privacy flag where a value that has been set determines whether information of the location of the mobile station is to be transmitted (col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the privacy flag can selectively set to cause wireless the mobile station to not transmit location information of the mobile station and can set a value of location privacy flag whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus, obviously suggested sending location information if the privacy preference associated with the requestor has not been specified otherwise. However, Moles did not clearly explain the claimed requesting a privacy preference associated with the requestor if a privacy preference associated with the requestor has not been specified.

Hertz, et al. teaches the location enhanced information delivery system can improve the user-user automatic matching techniques by notifying users of other users that are located in or near the same vicinity and match the profile conditions as consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses access control criteria dictating profile access and reachability of the user may be controlled accordingly based upon the profile of the requestor and/or the nature of the request (col.15, lines 11-36). Hertz includes the ability of queries and tasks

requirements in the form of request (col.15, lines 4-6). Access control criteria dictating

profile access and reachability of the user and construction of conveniently navigable

hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses

data mining tools can be used to enable advertisers to identify relevant features and

may enter rules that specify how users are to be targeted based on desired criteria

(col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests

ability for determining if a privacy preference associated with the requestor has been

specified or not and to enable or restrict the ability of an explicitly identified user (col.15,

lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be

transmitted. Thus, suggests the ability to request a privacy preference associated with

the requestor from the user in response to receiving the request if the privacy

preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to

combine the teaching of Moles with Hertz to teach if a privacy preference associated

with the requestor has not been specified, requesting a privacy preference in response

to receiving the request because access control dictating profile access and reachability

of the user may be controlled based upon the profile of the requestor such access

control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16,

lines 1-7).

As per claim 8: See Moles on col.6, lines 57-61 and col.9, lines 51-60; discusses

enabling the user to selectively enable and disable location-aware computing includes

providing an option during basic input/output system configuration to enable and disable location-aware computing.

As per claim 9: See Moles on col.2, lines 36-39 and col.2, line 66 – col.3, line 2; discusses setting a location privacy setting bit in response to the user selectively enabling or disabling location-aware computing.

As per claim 10: See Moles on col.2, lines 65-67 and Hertz on col.10, lines 24-35; discusses setting the location privacy setting bit includes setting a bit in BIOS memory.

As per claim 11: See Moles on col.2, lines 10-41 and col.6, lines 57-61; discusses receiving a request for the location property from the requestor, and querying the location privacy setting bit to determine whether location-aware computing is enabled or disabled.

As per claim 12: See Moles on col.9, lines 50-60; discusses setting and querying are performed using Advanced Configuration and Power Interface (ACPI)-based techniques.

As per claim 13:

Moles disclose a machine-accessible medium storing instructions that, when executed by a machine, cause the machine to:

in response to receiving a request from a requestor for a location property, determine whether a privacy preference **(col.2, lines 31-40 and col.2, line 60 – col.3, line 2;** *privacy flag***)** associated with the requestor has been specified; and **(col.2, lines 10-40 and col.6, lines 21-25)**

if a privacy preference associated with the requestor has been specified,

applying the privacy preference to determine whether to provide or withhold the location

property; and **(col.7, lines 5-12 and col.10, lines 37-57)**

if a privacy preference associated with the requestor has not been specified

(col.7, lines 14-18 and col.9, lines 50-53), request that the privacy preference be

specified in response to receiving the request. **(col.6, line 60 – col.7, line 5 and col.8,**

lines 37-64)

The computer system can broadly be given as a wireless mobile station (col.4,

lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the

mobile station's location is referring to the claimed requestor for the location of the

computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the

ability to selectively transmit the location of the wireless mobile station to authorized

parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the

transmission of information concerning the location of the wireless mobile station (col.3,

lines 40-44). This obviously suggests the ability to set to transmit or not transmit the

location property to a particular requestor(s) which in Moles' instance, is for authorized

parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a

privacy preference associated with the requestor has been specified. Moles discusses

the claimed privacy preference as the privacy flag where a value that has been set

determines whether information of the location of the mobile station is to be transmitted

(col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the

privacy flag can selectively set to cause wireless the mobile station to not transmit

location information of the mobile station and can set a value of location privacy flag
whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus,
obviously suggested sending location information if the privacy preference associated
with the requestor has not been specified otherwise. However, Moles did not clearly
explain the claimed requesting a privacy preference associated with the requestor if a
privacy preference associated with the requestor has not been specified.

 Hertz, et al. teaches the location enhanced information delivery system can
improve the user-user automatic matching techniques by notifying users of other users
that are located in or near the same vicinity and match the profile conditions as
consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses
access control criteria dictating profile access and reachability of the user may be
controlled accordingly based upon the profile of the requestor and/or the nature of the
request (col.15, lines 11-36). Hertz includes the ability of queries and tasks
requirements in the form of request (col.15, lines 4-6). Access control criteria dictating
profile access and reachability of the user and construction of conveniently navigable
hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses
data mining tools can be used to enable advertisers to identify relevant features and
may enter rules that specify how users are to be targeted based on desired criteria
(col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests
ability for determining if a privacy preference associated with the requestor has been
specified or not and to enable or restrict the ability of an explicitly identified user (col.15,
lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be transmitted. Thus, suggests the ability to request a privacy preference associated with the requestor from the user in response to receiving the request if the privacy preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to combine the teaching of Moles with Hertz to teach if a privacy preference associated with the requestor has not been specified, requesting a privacy preference in response to receiving the request because access control dictating profile access and reachability of the user may be controlled based upon the profile of the requestor such access control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16, lines 1-7).

As per claim 14: Cancelled.

As per claim 15: See Moles on col.6, lines 21-24 and Hertz on col.18, lines 52-55; discloses provide a pop-up dialog box to request the privacy preference.

As per claim 16: See Moles on col.2, line 66 – col.3, line 2; discloses determine whether the machine is enabled for location-aware computing.

As per claim 17: See Moles on col.7, lines 14-45 and Hertz on col.13, lines 24-46 and col.15, lines 3-45; discloses if the machine is not enabled for location-aware computing, preventing the machine from providing the requested location property regardless of whether the privacy preference has been specified and, if specified, regardless of the contents of the privacy preference.

As per claim 18:

Moles disclose a method comprising:

in response to receiving a request for a location property from a requestor,

determining whether a computer system is enabled for location-aware computing;

(col.2, lines 10-40 and col.6, lines 21-25)

if the computer is enabled for location-aware computing, determining

whether a privacy preference associated with the requestor has been specified; **(col.3,**

lines 30-34 and col.2, line 60 – col.3, line 2; *privacy flag***)**

if the privacy preference associated with the requestor has been specified,

applying the privacy preference to determine whether to provide the location property;

and **(col.7, lines 5-12 and col.10, lines 37-57)**

if the privacy preference associated with the requestor has not been specified

(col.7, lines 14-18 and col.9, lines 50-53), requesting the privacy preference

associated with the requestor in response to receiving the request. **(col.6, line 60 –**

col.7, line 5 and col.8, lines 37-64)

The computer system can broadly be given as a wireless mobile station (col.4,

lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the

mobile station's location is referring to the claimed requestor for the location of the

computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the

ability to selectively transmit the location of the wireless mobile station to authorized

parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the

transmission of information concerning the location of the wireless mobile station (col.3,

lines 40-44). This obviously suggests the ability to set to transmit or not transmit the

location property to a particular requestor(s) which in Moles' instance, is for authorized
parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a
privacy preference associated with the requestor has been specified. Moles discusses
the claimed privacy preference as the privacy flag where a value that has been set
determines whether information of the location of the mobile station is to be transmitted
(col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the
privacy flag can selectively set to cause wireless the mobile station to not transmit
location information of the mobile station and can set a value of location privacy flag
whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus,
obviously suggested sending location information if the privacy preference associated
with the requestor has not been specified otherwise. However, Moles did not clearly
explain the claimed requesting a privacy preference associated with the requestor if a
privacy preference associated with the requestor has not been specified.

     Hertz, et al. teaches the location enhanced information delivery system can
improve the user-user automatic matching techniques by notifying users of other users
that are located in or near the same vicinity and match the profile conditions as
consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses
access control criteria dictating profile access and reachability of the user may be
controlled accordingly based upon the profile of the requestor and/or the nature of the
request (col.15, lines 11-36). Hertz includes the ability of queries and tasks
requirements in the form of request (col.15, lines 4-6). Access control criteria dictating
profile access and reachability of the user and construction of conveniently navigable

hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses

data mining tools can be used to enable advertisers to identify relevant features and

may enter rules that specify how users are to be targeted based on desired criteria

(col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests

ability for determining if a privacy preference associated with the requestor has been

specified or not and to enable or restrict the ability of an explicitly identified user (col.15,

lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be

transmitted. Thus, suggests the ability to request a privacy preference associated with

the requestor from the user in response to receiving the request if the privacy

preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to

combine the teaching of Moles with Hertz to teach if a privacy preference associated

with the requestor has not been specified, requesting a privacy preference in response

to receiving the request because access control dictating profile access and reachability

of the user may be controlled based upon the profile of the requestor such access

control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16,

lines 1-7).

As per claim 19: See Moles on col.6, lines 21-24 and Hertz on col.18, lines 52-55;

discloses requesting the privacy preference comprises providing a pop-up dialog box.

As per claim 20: See Moles on col.2, lines 65-67 and Hertz on col.10, lines 24-35;

discloses determining whether a computer system is enabled for location-aware

computing comprises determining a value stored in a location privacy setting in basic input/output system (BIOS) memory.

As per claim 21: See Moles on col.6, lines 56-57; discloses enabling a user to enable and disable location-aware computing through a BIOS configuration routine.

As per claim 22: See Moles on col.9, lines 9-34 and 50-60; discloses using WMI/ACPI instrumentation techniques to set and determine the value stored in the location privacy setting.

As per claim 23:

Moles disclose a system comprising:

a bus to communicate information; **(col.5, lines 21-22)**

a processor coupled to the bus; **(col.4, lines 51-57)**

a memory coupled to the bus to store information; **(col.2, lines 65-66)**

an antenna coupled to the bus to receive a signal to indicate a location of the system; and **(col.2, lines 5-15)**

a machine-accessible storage medium storing instructions that, when executed by the processor, cause the system to:

in response to receiving a request for a location property associated with the system from a requestor **(col.2, lines 10-15 and col.6, lines 21-25)**, determine whether a privacy preference associated with the requestor has been specified; and **(col.2, lines 31-40 and col.2, line 64 – col.3, line 2; *privacy flag*)**

if a privacy preference has been specified **(col.3, lines 30-34)**, apply the privacy preference to determine whether to provide the requested location property; **(col.7, lines 5-12 and col.10, lines 37-57)**

if a privacy preference associated with the requestor has not been specified **(col.7, lines 14-18 and col.9, lines 50-53)**, request that the privacy preference be specified in response to receiving the request. **(col.6, line 60 – col.7, line 5 and col.8, lines 37-64)**

The computer system can broadly be given as a wireless mobile station (col.4, lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the mobile station's location is referring to the claimed requestor for the location of the computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the ability to selectively transmit the location of the wireless mobile station to authorized parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the transmission of information concerning the location of the wireless mobile station (col.3, lines 40-44). This obviously suggests the ability to set to transmit or not transmit the location property to a particular requestor(s) which in Moles' instance, is for authorized parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a privacy preference associated with the requestor has been specified. Moles discusses the claimed privacy preference as the privacy flag where a value that has been set determines whether information of the location of the mobile station is to be transmitted (col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the privacy flag can selectively set to cause wireless the mobile station to not transmit

location information of the mobile station and can set a value of location privacy flag

whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus,

obviously suggested sending location information if the privacy preference associated

with the requestor has not been specified otherwise. However, Moles did not clearly

explain the claimed requesting a privacy preference associated with the requestor if a

privacy preference associated with the requestor has not been specified.

Hertz, et al. teaches the location enhanced information delivery system can

improve the user-user automatic matching techniques by notifying users of other users

that are located in or near the same vicinity and match the profile conditions as

consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses

access control criteria dictating profile access and reachability of the user may be

controlled accordingly based upon the profile of the requestor and/or the nature of the

request (col.15, lines 11-36). Hertz includes the ability of queries and tasks

requirements in the form of request (col.15, lines 4-6). Access control criteria dictating

profile access and reachability of the user and construction of conveniently navigable

hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses

data mining tools can be used to enable advertisers to identify relevant features and

may enter rules that specify how users are to be targeted based on desired criteria

(col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests

ability for determining if a privacy preference associated with the requestor has been

specified or not and to enable or restrict the ability of an explicitly identified user (col.15,

lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be transmitted. Thus, suggests the ability to request a privacy preference associated with the requestor from the user in response to receiving the request if the privacy preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to combine the teaching of Moles with Hertz to teach if a privacy preference associated with the requestor has not been specified, requesting a privacy preference in response to receiving the request because access control dictating profile access and reachability of the user may be controlled based upon the profile of the requestor such access control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16, lines 1-7).

As per claim 24: See Moles on col.2, line 66 – col.3, line 2; discloses the machine-accessible storage medium further stores instructions that, when executed by the processor, cause the system to determine whether the system is enabled for location-aware computing.

As per claim 25: See Moles on col.2, lines 65-67 and Hertz on col.10, lines 24-35; discloses the memory includes a basic input/output system (BIOS) memory and wherein determining whether the system is enabled for location-aware computing includes determining a value stored in a location in the BIOS memory.

As per claim 26: See Moles on col.7, lines 14-45 and Hertz on col.13, lines 24-46 and col.15, lines 3-45; discloses storing instructions that, when executed by the processor, cause the system to request the privacy preference associated with the requestor if it is

determined that the privacy preference associated with the requestor has not been
specified.

As per claim 27: See Moles on col.6, lines 21-24 and Hertz on col.18, lines 52-55;
discloses requesting the privacy preference includes providing a pop-up dialog box.

As per claim 28: See Moles on col.4, lines 45-65; discloses the requestor is one of a
client application and a location-based service.

As per claim 29:

Moles disclose a method comprising:

receiving a query requesting one or more location properties; **(col.2, lines 10-15
and col.6, lines 8-25)**

determining if location aware computing is enabled; **(col.6, lines 56-60)**

if the location aware computing is enabled, then determining whether user
privacy preferences have been specified; **(col.3, lines 30-34 and col.2, line 60 – col.3,
line 2;** *privacy flag***)**

if user privacy preferences have not been specified, requesting user privacy
preferences associated with each of the one or more location properties
requested; **(col.6, lines 57-67 and col.9, lines 50-53)**

determining whether privacy is indicated for each of the requested one or
more location properties; **(col.9, line 50 - col.10, line 5)**

for any of the requested one or more location properties in which privacy

is not indicated, obtaining the requested one or more location properties and

sending the requested one or more location properties; and **(col.7, lines 14-18 and**

col.9, lines 50-53)

for any of the requested one or more location properties in which privacy

is indicated, blocking the requested one or more location properties for which

privacy is indicated. **(col.7, lines 5-12 and col.10, lines 37-57)**

The computer system can broadly be given as a wireless mobile station (col.4,

lines 45-54). Moles teach the operator or (authorized) party requesting or receiving the

mobile station's location is referring to the claimed requestor for the location of the

computer system (col.2, lines 20-22 and 38-40). Moles discloses the user have the

ability to selectively transmit the location of the wireless mobile station to authorized

parties (col.2, lines 38-40). Moles also disclose a method fro selectively disabling the

transmission of information concerning the location of the wireless mobile station (col.3,

lines 40-44). This obviously suggests the ability to set to transmit or not transmit the

location property to a particular requestor(s) which in Moles' instance, is for authorized

parties (col.8, lines 37-64). Thus, Moles suggests the claimed determining whether a

privacy preference associated with the requestor has been specified. Moles discusses

the claimed privacy preference as the privacy flag where a value that has been set

determines whether information of the location of the mobile station is to be transmitted

(col.2, line 60 – col.3, line 2 and col.6, lines 56-61). In addition, Moles discloses the

privacy flag can selectively set to cause wireless the mobile station to not transmit

location information of the mobile station and can set a value of location privacy flag whether location information is to be transmitted (col.6, line 56-col.7, line 5). Thus, obviously suggested sending location information if the privacy preference associated with the requestor has not been specified otherwise. However, Moles did not clearly explain the claimed requesting a privacy preference associated with the requestor if a privacy preference associated with the requestor has not been specified.

Hertz, et al. teaches the location enhanced information delivery system can improve the user-user automatic matching techniques by notifying users of other users that are located in or near the same vicinity and match the profile conditions as consistent with the privacy policies of users (col.13, lines 30-42). Hertz discloses access control criteria dictating profile access and reachability of the user may be controlled accordingly based upon the profile of the requestor and/or the nature of the request (col.15, lines 11-36). Hertz includes the ability of queries and tasks requirements in the form of request (col.15, lines 4-6). Access control criteria dictating profile access and reachability of the user and construction of conveniently navigable hierarchical menus (col.14, lines 15-17 and col.15, lines 12-25). Hertz also discloses data mining tools can be used to enable advertisers to identify relevant features and may enter rules that specify how users are to be targeted based on desired criteria (col.16, lines 1-7). Hertz suggests querying and database matching obviously suggests ability for determining if a privacy preference associated with the requestor has been specified or not and to enable or restrict the ability of an explicitly identified user (col.15, lines 16-20). With Hertz suggesting querying with data mining tools and Moles capable

of entering a response in response to a question whether location information is to be transmitted. Thus, suggests the ability to request a privacy preference associated with the requestor from the user in response to receiving the request if the privacy preference associated with the requestor has not been specified.

Therefore, it would have been obvious for a person of ordinary skills in the art to combine the teaching of Moles with Hertz to teach if a privacy preference associated with the requestor has not been specified, requesting a privacy preference in response to receiving the request because access control dictating profile access and reachability of the user may be controlled based upon the profile of the requestor such access control may be used to enable/restrict access (Hertz-col.15, lines 11-46 and col.16, lines 1-7).

As per claim 30: See Moles on col.6, lines 21-24 and Hertz on col.18, lines 52-55; discloses the method of claim 29, wherein requesting user privacy preferences associated with each of the one or more location properties includes providing a pop-up dialog box.

As per claim 31: See Moles on col.9, lines 50-53 and col.10, lines 37-57 and Hertz on col.18, lines 52-55; discloses the method of claim 30, wherein providing a pop-up dialog box includes enabling a user to selectively enable and disable privacy preferences for each individual location property.

Conclusion

4.   THIS ACTION IS MADE FINAL. Applicant is reminded of the extension
of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire
THREE MONTHS from the mailing date of this action. In the event a first reply
is filed within TWO MONTHS of the mailing date of this final action and the
advisory action is not mailed until after the end of the THREE-MONTH
shortened statutory period, then the shortened statutory period will expire on
the date the advisory action is mailed, and any extension fee pursuant to 37
CFR 1.136(a) will be calculated from the mailing date of the advisory action. In
no event, however, will the statutory period for reply expire later than SIX
MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications
from the examiner should be directed to Leynna T. Truvan whose telephone
number is (571) 272-3851. The examiner can normally be reached on Monday
- Thursday (7:00 - 5:00PM).

If attempts to reach the examiner by telephone are unsuccessful, the
examiner's supervisor, Kim Vu can be reached on (571) 272-3859. The fax
phone number for the organization where this application or proceeding is
assigned is 571-273-8300.

Information regarding the status of an application may be obtained from

the Patent Application Information Retrieval (PAIR) system. Status information

for published applications may be obtained from either Private PAIR or Public

PAIR. Status information for unpublished applications is available through

Private PAIR only. For more information about the PAIR system, see
